

CUSTOMER & MVP BLUEPRINT

RoadGuard India — B2B Fleet Safety & Breakdown Dispatch

Prepared for Founder Review | Market: India | June 2026

Executive Summary

RoadGuard India pivots from a consumer-facing highway emergency reporting app to a B2B fleet safety and breakdown/fuel dispatch platform for Indian logistics and fleet operators. The original consumer concept faces direct structural overlap with the government's 112 India / ERSS emergency dispatch system, making B2C differentiation and adoption extremely difficult. The B2B fleet variant sidesteps this overlap entirely — fleet operators are not served by 112/ERSS for operational breakdowns, fuel issues, and driver safety incidents, creating a defensible wedge.

This Blueprint treats the idea as concept-stage with no MVP, no users, and no direct customer validation yet. All recommendations below are hypotheses to be tested through structured customer discovery — not confirmed market facts. The immediate next step, before any code is written, is running 15–20 discovery interviews with fleet owners, fleet managers, and logistics operations heads.

Dimension	Summary
Idea	B2B fleet safety + breakdown/fuel dispatch coordination app
Problem	Slow, fragmented response to breakdowns, fuel emergencies, and safety incidents for commercial fleets on Indian highways
Target Customer	Fleet owners & operations managers at SME/mid-size logistics and trucking companies (India)
Key Competitor Risk	112 India / ERSS covers consumer emergencies, NOT commercial fleet operations — low direct overlap in this segment
Validation Stage	Concept only — no MVP, no users, no interviews conducted yet

Ideal Customer Profile (ICP)

Attribute	Profile
Company type	SME/mid-size road logistics, trucking, or fleet rental companies
Fleet size	15–200 commercial vehicles (trucks, tempos, cargo vans)
Geography	Operates on national/state highways across 2+ Indian states
Operating model	Owns and dispatches drivers directly, or manages a mixed owned + leased fleet
Pain intensity	Experiences breakdowns, fuel incidents, or accidents on the road at least weekly
Tech readiness	Already uses at least one digital tool (GPS tracking, WhatsApp groups, basic ERP)
Budget holder	Operations Manager or Fleet Owner with direct authority over

Attribute	Profile
	software spend

Buyer Persona

“Operations Owais” — Fleet Operations Manager

Age / Role	32–45, Operations/Fleet Manager at a logistics or trucking company
Daily reality	Coordinates 30–150 vehicles via phone calls and WhatsApp; reacts to breakdown calls in real time
Goals	Minimize vehicle downtime, protect driver safety, hit delivery SLAs, control fuel/repair costs
Frustrations	No visibility until a driver calls; relies on informal mechanic contacts; delays cascade into client penalties
Tech comfort	Comfortable with WhatsApp, basic GPS dashboards; skeptical of “yet another app” without clear ROI
Decision trigger	A bad breakdown that caused a major client SLA miss or safety incident

Top 10 Customer Pain Points

- No real-time visibility into breakdown or accident status once a driver calls in
- Reliance on informal/personal mechanic and tow contacts with inconsistent response times
- Fuel-related breakdowns (running dry, contamination) cause avoidable downtime
- Driver safety incidents are reported late, delaying medical or roadside help
- Delivery SLA penalties from clients when downtime isn't resolved quickly
- No structured incident log for insurance claims or post-incident analysis
- Fragmented communication across WhatsApp, phone calls, and paper logs
- Difficulty verifying driver-reported incidents (location, severity, photos)
- No standardized vendor network for breakdown/towing across multiple states
- Operations managers spend hours daily firefighting instead of planning routes

Customer Journey

Awareness → Consideration → Purchase → Retention

Awareness	Consideration	Purchase	Retention
Hears about RoadGuard via logistics WhatsApp groups, LinkedIn, or industry associations	Compares against doing nothing, hiring more staff, or generic fleet-tracking tools; asks peers for	Requests a pilot on a subset of fleet (e.g. 10–20 vehicles) before company-wide rollout; price-sensitive	Stays if dispatch response time visibly improves and drivers actually adopt the app; churns if drivers

Awareness	Consideration	Purchase	Retention
after a costly breakdown incident	references	at SME scale	ignore it

Key Customer Objections

- “My drivers already call me directly — why do I need an app?”
- “We already have a GPS tracking tool; this feels redundant.”
- “Our drivers aren’t tech-savvy enough to use another app reliably.”
- “How is this different from just having a mechanic on speed dial?”
- “What happens in low-network highway zones where this matters most?”
- “We’re a small operation — this looks built for large fleets.”

Key Buying Triggers

- A recent breakdown or accident caused a major client SLA penalty
- A driver safety incident with delayed response drew management attention
- Fleet is scaling beyond what informal phone/WhatsApp coordination can handle
- Insurance or compliance audit exposes lack of incident documentation
- A competitor or peer fleet operator is already using a similar tool

MVP Recommendation

What should be built first?

- Driver-side: one-tap incident/breakdown report with auto-captured GPS location
- Dispatcher-side: live dashboard showing active incidents across the fleet
- A curated, manually-vetted directory of mechanics/tow vendors per route/region (even if manual at first)
- Basic incident log/history per vehicle for SLA and insurance reference

What should NOT be built?

- Full GPS fleet-tracking suite (redundant with tools customers already use)
- Consumer-facing emergency reporting features (the original B2C scope)
- Automated AI-based incident severity detection (premature before manual process is validated)
- Payments/insurance integration (defer until core workflow is proven)

Success Metrics (first 90 days post-launch)

Metric	Target
Pilot fleets onboarded	3–5 fleet operators (15–200 vehicles each)
Driver adoption rate	≥60% of drivers in pilot fleets use the app for at least one incident

Metric	Target
Avg. response time improvement	≥20% faster than prior informal process (self-reported baseline)
Operator willingness to pay	≥2 of 3–5 pilots convert to a paid plan after pilot

MoSCoW Prioritization

Priority	Items
Must Have	One-tap incident reporting w/ GPS • Dispatcher live dashboard • Manual vendor directory • Basic incident log
Should Have	SMS fallback for low-network zones • Driver photo/voice note attachment • Basic SLA timer per incident
Could Have	Multi-fleet benchmarking dashboard • Automated vendor rating system • WhatsApp bot integration
Won't Have (v1)	Full GPS tracking suite • AI severity detection • Insurance/payment integration • Consumer (B2C) features

Pricing Hypothesis

Unvalidated — to be tested directly in discovery interviews and pilot conversations:

- Per-vehicle/month SaaS pricing (e.g. ₹50–₹150 per vehicle/month) — scales naturally with fleet size
- Tiered flat plans by fleet size band (e.g. up to 25 / 50 / 100+ vehicles) for easier budgeting by SME operators
- Free pilot (30–60 days) on a subset of fleet to prove response-time improvement before any commercial ask

Top 5 Risks

Risk	Detail
No validated demand	Zero customer interviews conducted — pain severity and willingness to pay are assumptions, not facts
Driver adoption failure	Drivers may default back to phone calls if the app isn't faster/easier than existing habits
Vendor network is hard to scale	Manually vetted mechanic/tow directory is labor-intensive to build state-by-state
Network connectivity gaps	Many highway stretches have poor connectivity; app must degrade gracefully (SMS/offline) or lose core value
Long enterprise sales cycles	Even SME fleet operators may take weeks/months to evaluate and approve a new tool

30-Day MVP Plan

Week	Focus
Week 1	Conduct 15–20 customer discovery interviews with fleet owners/operations managers; validate pain severity and willingness to pay
Week 2	Synthesize findings; finalize MVP scope (Must Haves only); recruit 3–5 pilot fleet partners
Week 3	Build clickable prototype (driver report flow + dispatcher dashboard); manually build initial vendor directory for pilot regions
Week 4	Run pilot prototype test with real incidents (even semi-manually); collect response-time and adoption data; decide go/no-go on build

Founder Action Sheet

Top 10 next actions

1. Draft a discovery interview script focused on breakdown/incident frequency and current cost of downtime
2. List and contact 20+ fleet owners/operations managers via LinkedIn, trucking associations, and personal network
3. Conduct 15–20 discovery interviews before writing a single line of product code
4. Validate whether 112/ERSS or any existing players already serve fleet-specific breakdown dispatch in target regions
5. Identify 3–5 fleet operators willing to run a free pilot
6. Manually map mechanic/tow vendor contacts for at least 2 pilot regions
7. Define the single clearest success metric for the pilot (e.g. response time reduction)
8. Build a low-fidelity clickable prototype (Figma or no-code) before any real development
9. Test pricing willingness directly in interviews — do not assume a number
10. Set a hard go/no-go decision date after the pilot to avoid open-ended exploration

Scores (0–100)

Dimension	Score	Rationale
Customer Clarity	55 / 100	ICP defined but untested
Problem Severity	60 / 100	Plausible, high-stakes pain, not yet confirmed
PMF Potential	45 / 100	Reasonable wedge vs. 112/ERSS, but zero market evidence
MVP Readiness	35 / 100	Clear scope exists, but no prototype or pilot commitments yet

Final Verdict

PROMISING BUT UNVALIDATED

The B2B fleet pivot avoids the structural overlap with 112/ERSS that sank the original consumer concept, and the pain points described are plausible and high-stakes. However, this assessment rests entirely on reasoning, not evidence — no fleet operator has been interviewed, no prototype exists, and no one has said “I would pay for this.” The single highest-leverage action is running real customer discovery interviews before any further product investment.
